

WHO Monitoring a New COVID Variant in India and Marburg Virus in Africa

FSI News by Mark Conron – April 10/2023

Think we are remotely ready for another worldwide virus - how about two at the same time?

The new dominant COVID variant in India is XBB.1.16 and it bears watching according to WHO because of how quickly it has replaced other variants.

In Tanzania a new very deadly cousin of Ebola called the Marburg virus is being monitored with worries of an outbreak.

The question is not if another worldwide pandemic will hit but merely when!

All those tasked with monitoring and preparation from WHO to The CDC and other such agencies must find a way to be ready the next time and will need substantial budgets to do so*

The next time a world weary of Pandemic will not be so quick to listen or follow recommendations - and so any that are issued must be based on science that all can and will agree on. And world leaders must do all in their power NOT to cause panic and NOT to shut down their economies since both can and often do cause much longer lasting damage than the virus itself.

*Preparedness must be the key - Vaccines/treatments, PPE, decon shower systems, drive thru vaccine shot shelters, isolation shelters/chambers, mobile field hospital systems, et al. All easy to say but then there's the equally divided, seemingly dysfunctional Congress that must allocate the funds. Will they? How much? When?

FSI personnel are preparing for the FDIC in Indianapolis where we invite you to see our preparedness products in booth 1008 April 26-29.

Stay safe one and all!
